

Technical Data Sheet: IT Control Box – Intelligent Automation & Governance

Technical Summary

IT Control Box is an integrated automation and governance solution. It operates as an intelligent layer over existing enterprise systems {ITSM, AD, Azure}, centralizing control, enforcing security policy, and eliminating manual administrative tasks.

Core Technical Principles

- **Reduced Administrative Reliance:** Minimizes the need for standing privileged accounts by executing tasks with the least required permissions, reducing the attack surface.
- **Enforced Procedural Discipline:** Ensures complex, multi-step processes are executed consistently and without human error through validated, automated workflows.
- **Immutable Audit Trail:** Creates a comprehensive and traceable record of every administrative activity, including requester and context, for compliance and forensic analysis.
- **Human-in-the-Loop Governance:** Automation is triggered only upon receipt of a valid, approved ticket from an integrated ITSM system, ensuring all actions are formally authorized and tracked.

Integration Architecture

IT Control Box augments the existing IT ecosystem, providing a unified control plane for automation without adding infrastructure overhead. It integrates natively to orchestrate tasks across core platforms.

IT Control Box: Technical Capabilities

Intelligent Identity Governance & Administration (IGA)	
• Identity Lifecycle Management: Automates user onboarding, deboarding, and role changes triggered by HRMS data, including partial access revocation to enforce the principle of least privilege. • Bulk Identity Operations: Manages large-scale user creation and revocation for events like M&A or vendor projects, ensuring process scalability and consistency. • Excess Access Detection: Continuously audits persona-based access definitions against actual user permissions to identify and report on privilege creep. • Emergency Identity Quarantine: Single-action mechanism to instantly disable an identity across AD, Azure, and integrated applications based on an emergency request.	• Secured Credential Management: Audited workflows for password resets (with user-friendly random generation excluding ambiguous characters) and MFA resets. • Automated Hostname Recycling: Manages the multi-step reuse of hostnames across AD, Azure, and Intune, programmatically preventing synchronization conflicts. • Comprehensive Reporting: Generates reports on identity security posture (excess group memberships), policy exceptions (inactive users, non-expiring passwords), and password hygiene gaps (reuse, hardcoding). • Security Incident Orchestration: Triggers automated threat responses (password reset, forced logoff, MFA invocation, disable Outlook access) based on security alerts from integrated systems.
Secure Endpoint Management & Operations	
• Local Admin Password Solution {LAPS}: Automates the rotation of local administrator passwords. Passwords are encrypted (4Kcertified) and retrieved on-demand via an audited, time-bound process, eliminating standing local privileges. • Secure BitLocker Key Retrieval: Provides audited, just-in-time access for IT support to retrieve Bitlocker recovery keys from AD or Azure AD, with full activity logging. • Intune Device Lifecycle Management: Automates the addition of devices to Intune via hardware hash or serial number, and the removal of registered devices.	• Policy-Based Exception Management: Manages temporary, time-bound access exceptions (e.g., USB access, Geo-Fencing bypass) by updating Azure Group Memberships with automated, scheduled revocation. • Device Compliance Monitoring: Provides real-time status checks of device compliance against Azure AD and Intune policies. • Automated Policy Swapping: Updates AD/Azure Group memberships to correctly apply OS-specific policies when a user swaps between device types (e.g., Windows to Mac), preventing security gaps.

IT Control Box: Advanced Automation in end point and collaboration

Standard Operating Environment (SOE)Automation

An end-to-end solution for deploying secure, standardized OS images, ensuring configuration consistency and reducing manual provisioning errors.

- | | |
|--|--|
| <ul style="list-style-type: none">• Deployment Tool Integration: Natively integrates with existing infrastructure including SCCM, MDT, Intune, and Autopilot.• Automated & Context-Aware Configuration: Performs automated domain joins to AD or Azure AD, placing the device in the correct OU based on user profile, geography, or business unit. | <ul style="list-style-type: none">• Embedded Security Hardening: Leverages industry best practices (CIS,NIST, IS027001) to harden the OS image during the deployment workflow.• Controlled System Decommissioning: Provides an automated, multi-system workflow to correctly remove decommissioned devices from AD, Intune, and other management platforms. |
|--|--|

0365 Administration & Automation

A suite of automations for managing 0365 user objects and permissions with full auditability, ensuring consistent policy application.

- | | |
|--|---|
| <ul style="list-style-type: none">• Persona-Based License Assignment: Automates the allocation of specific 0365 SKUs based on user role, department, or other pre-defined persona definitions.• Time-Bound Access Control: Manages short-term license allocation and automated revocation for temporary projects or contract users. | <ul style="list-style-type: none">• Delegated Permissions Management: Automates the assignment and scheduled revocation of mailbox delegations (Full Control, Send-As) and email forwarding rules, with validation to ensure forwarding is restricted to internal domains.• Automated Object Management: Audited workflows for creating and managing distribution lists, updating email addresses, and controlling OneDrive for Business activation. |
